# Water Measurement Calculations 

Dean E. Eisenhauer and Paul E. Fischbach, Extension Irrigation Specialists

- Units of Water Measurement
- Volume
- Flow
- Example Calculations
- Application Formula

Water measurement is an important tool for checking irrigation management skills. Irrigators can use one of several methods to measure water. To take advantage of water management data, a knowledge of water measurement calculations is important.

## Units of Water Measurement

There are two conditions under which water is measured--at rest and in motion. Volume units are used for water at rest. Water in motion is described in units of flow.

## Volume

Volume units describe how much space a given amount of water will occupy. Water in tanks and ponds is an example of water at rest. Common units of volume are gallons, acre-inches, acre-feet, and cubic feet. These units are defined as:

Acre-inch--the volume of water that would cover an acre one inch deep.
Acre-foot--the volume of water that would cover an acre one foot deep.
Cubic foot--the amount of water that would fill a container one foot wide by one foot long by one foot deep.

## Flow

Flow units tell how fast a given volume of water is moving past a fixed point. They can be used to describe the discharge of a pump, flow in a canal or river, and discharge of a sprinkler, gate, or siphon
tube. Flow units frequently used in irrigation are gallons per minute (gpm) and cubic feet per second (cfs).

Gallons per minute--the rate of flow necessary to fill a gallon container in one minute.
Cubic foot per second--the amount of water that would flow in a stream one foot wide by one foot deep and moving at a rate of one foot every second.

Table I shows a list of equivalents of water measurement units.
By knowing the rate of flow, the volume of water used over a period of time can be calculated using the equivalents in Table I. As an example, a system that delivers 900 gpm can apply two inches to one acre in one hour ( $900 \mathrm{gpm} \div 450 \mathrm{gpm}$ per acre-inch per hour $=2$ acre inches). Table II can be used to determine the volume of water applied for different time periods and various flow rates.

| Table I. List of Equivalents |
| :--- |
| 1 gallon $=8.33$ pounds |
| 1 cubic foot $=7.48$ gallons |
| 1 acre-inch $=3,630$ cubic feet |
| 1 acre-inch $=27,154$ gallons |
| 1 acre-foot $=43,560$ cubic feet |
| 1 acre-foot $=325,851$ gallons |
|  |
| 1 cubic foot per second $=449$ gallons per minutes $(450$ for practical purposes) |
| 1 cubic foot per second for 1 hour $=1$ acre-inch |
| 452 gallons per minute for 1 hour $=1$ acre-inch |
| 1 gallon per minute $=0.00223$ cubic feet per second |
| 1 gallon per minute $=0.00221$ acre-inches per hour |
|  |
| 1 mile $=5280$ feet |
| 1 mile $=320$ rods |
| 1 rod $=16.5$ feet |
|  |
| 1 acre $=43,560$ square feet |
| 1 acre $=160$ square rods |

Table II. Volume of water applied for various flow rates and time periods.

| Flow Rate | Volume Applied |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{1 ~ H r}$. | $\mathbf{8 ~ H r s}$. | $\mathbf{1 2 ~ H r s .}$ | $\mathbf{1}$ Day |
| gpm | ac-in | ac-in | ac-in | ac-in |
| 100 | 0.22 | 1.77 | 2.65 | 5.3 |
| 200 | 0.44 | 3.54 | 5.31 | 10.6 |
| 300 | 0.66 | 5.31 | 7.96 | 15.9 |
| 400 | 0.88 | 7.08 | 10.6 | 21.2 |
| 500 | 1.11 | 8.85 | 13.3 | 26.5 |
| 600 | 1.33 | 10.6 | 15.9 | 31.9 |
| 700 | 1.55 | 12.4 | 18.6 | 37.2 |
| 800 | 1.77 | 14.2 | 21.2 | 42.5 |
| 900 | 1.99 | 15.9 | 23.9 | 47.8 |
| 1000 | 2.21 | 17.7 | 26.5 | 53.1 |
| 1100 | 2.43 | 19.5 | 29.2 | 58.4 |
| 1200 | 2.65 | 21.2 | 31.8 | 63.7 |
| 1300 | 2.87 | 23.0 | 34.5 | 69.0 |
| 1400 | 3.10 | 24.8 | 37.2 | 74.3 |
| 1500 | 3.32 | 26.5 | 39.8 | 79.6 |
| 2000 | 4.42 | 35.4 | 53.1 | 106 |

To calculate the depth of water applied, both the volume applied and the acres covered must be known. There are 43,560 square feet in an acre. Table III, Table IV, and Table V can be used as a guide in calculating the acreage of total fields or an irrigation set.

## Example Calculations

Most water meters have a volume totalizer that registers either acre-feet, acre-inches, cubic feet, or gallons.

Example 1. Calculation of depth applied to a field with meter registration in acre-feet.
Given: Assume the field just irrigationd is 1,815 feet long and 1,320 feet wide.
Meter reading before irrigation $=162.8$ acre feet.
Meter reading after irrigation $=182.5$ acre feet.
Calculations:
Acre-feet applied = 19.7 acre-feet.
Acres in field = 55 acres (Table III).
Depth applied $=19.7$ acre-feet $\div 55$ acres $=0.358$
feet $=0.358 \times 12$ inches/foot $=4.3$ inches.

Example 2. Calculation of depth applied to field with meter registration in gallons.
Given: Same field--55 acres.
Meter reading before irrigation $=53,984,000$ gal.
Meter reading after irrigation $=58,924,000$ gal.
Calculations:
Gallons applied $=4,940,000$ gal .
Acre-inches applied $=4,940,000 \div 27,154($ Table $I)=181.9$ ac.-in.
Depth applied $=181.9$ ac. - in. $\div 55$ acres $=3.3$ in.
Example 3. Calculation of depth applied to field with meter that measures rate of flow only.
Given: Same field-55 acres.
Assume pump discharge $=800 \mathrm{gpm}$.
Days of irrigation $=7$ days.

## Calculations:

Acre-inches applied $=42.4$ ac-in/day (Table IV) x 7 days= 296.8 acre-inches.
Depth applied $=296.8$ ac-in $\div 55$ acres $=5.4$ inches.
Example 4. Calculations of depth applied to an irrigation set.

## Given:

-- Number of rows $=80$
-- Length of rows 1320 feet
-- Width of rows = 36 inches
-- 1000 gpm system
-- 12 hour set
Calculations:
Area of set $=6.1$ acres $\times 1.2($ Table $I V)=7.3$ acres.
Water applied $=26.5$ ac-in (Table II).
Depth applied $=26.5$ acre-inches $\div 7.3$ acres $=3.6$ inches.

## Application Formula

Application depth (inches) =
flow rate (gpm) x application period (hours) x 96.3

> irrigationd area (square feet)

Example 5. Same problem as Example 3 above.
Flow rate $=800$ gpm
Application period =- 7 days x 24 hrs/day = 168 hours
irrigationd area $=1815 \times 1320=2,395,800$ square feet.

$$
800 \text { X } 168 \text { X } 96.3
$$

Depth applied = $\qquad$ $=5.4$ inches
2,395,800 - 5.4 inches

Table III. Acres in a rectangular field.

|  |  |  | ---------------Width of Field-------------- |  |  |  |  |  |  |
